LENS PROGRAM

By working with a color spectrum selective light filter, we created a lens that mimics the behavior of noise cancelling headphones on a plane to eliminate color noise while riding. The CONTRAST BOOSTING LENS also boosts contrast, which enhances image definition to be able to see more details on the snow.

VLT is the amount of light transmitted through a lens. VLT transmittance is then translated into a Lens Category Number. The higher the number the more visual light that is transmitted through the lens. The lower the CAT number the more visual light that is transmitted through the lens.

Filter Category classified as:
 S0 Very light lens,
 S1 Light lens,
 S2 Medium lens,
 S3 Dark lens,
 S4 Very dark lens.
